Keywords: statistical data distortion; grassroots statistical work; discussion and analysis

Abstract: Since the reform and opening up, China's economy has developed rapidly. The current world economic integration has become an inevitable trend of development. With the further advancement of China's reform and opening up, China's economic market has also changed and changed from the previous planned economy. The transformation into a multi-economic coexisting market situation. As a basic reference method for reflecting the economic development of a country or region, it itself represents the state of China's economic development. In order to better observe China's economic situation, people have put forward higher requirements for statistical data work, giving the current In terms of statistical work, the data is required to be authentic and can help China's economic development. The main purpose of this paper is to solve the existing problems.

1. Introduction

Improving the accuracy of statistical data can help government departments at all levels in China to better play their role in decision-making and improve the government's credibility in society. Statistical data workers often come from the grassroots level. Different grassroots departments conduct statistics on different aspects of data, and submit various statistical data to higher authorities to help China develop its economy vigorously. At the same time, it can also develop many industries that are difficult to develop in the market. Provide support. However, there are many problems in the statistics of the grassroots departments in China. These problems lead to problems in the accuracy of statistical data, which brings new challenges to the grassroots statistical work. To ensure better development of the market economy, it is necessary to solve problems better. To improve the authenticity and accuracy of statistical data.

2. Problems in current grassroots statistical work

2.1 Excessive administrative intervention

At present, one of the reasons for the distortion of statistical data in the process of statistical data work in China's grassroots departments is that superior leaders have put too high demands on economic indicators for their own achievements. Many of the leading cadres at the higher levels have not considered the actual development of the local area and have requested the statistical data. As a grassroots department, in order to complete the tasks assigned by the higher level, they can only ignore the actual development and falsify the statistical data, and conceal the data according to the superior. The data required by the leadership is filled out, which leads to the source of the statistical data being “, “official figures and figures“, which leads to the fact that the statistical data does not objectively reflect the current development of China's society and directly reduces the credibility of the government departments themselves.

2.2 Statistical law enforcement is not strict

Many local government departments and employees at the grassroots level are not aware of the importance of statistics for social development. They even think that statistics are only a tool for government leaders. In the eyes of many grassroots employees, statistical work can be linked to interests, as long as The benefits are large enough to ignore the negative impact of statistical data on

social development. In many areas, SMEs have not established a comprehensive statistical system. Enterprises are also relatively random when reporting statistical data. Many enterprises still have tax evasion and tax evasion. These have led to distortions in the data information of corporate finance during the reporting process.

2.3 Department status needs to be improved

If the government departments do not care about the statistics made by the grassroots departments, even if they do not pay attention, the grassroots departments will lose their enthusiasm, and the leaders of the government departments will not be in line with the local development when making decisions. This is also the main reason for the current imbalance in the economic development of China's regions. Many government departments do not care about the statistical data collected by the grassroots departments, and even directly reduce the welfare of staff in the grassroots departments and reduce the staffing of grassroots departments. The practice has seriously reduced the enthusiasm of the staff of the grassroots departments, and has led to the continuous decline of the government's credibility. In many areas, there are more and more illegal phenomena and frauds. These phenomena are due to the statistics of the government departments for the grassroots departments. The data is not intended to be caused.

2.4 Personnel quality is not high

The statistical data work itself requires the staff to have a high degree of professionalism. In the actual work, the statistical data work is relatively complicated and easy to cause misunderstanding. In the process of statistical data investigation, the number of investigations is relatively large. Improving the accuracy of statistical data is relatively difficult. From the perspective of the current development of grassroots departments, there are few people responsible for statistical data, and the professional quality needs to be strengthened.

3. Improvement measures for grassroots statistical work

3.1 Improve system construction

In the current economic development, as the local government must truly understand the local political and economic development of the local society, and understand the development of local people's livelihood, as the government departments want to understand these situations, it is necessary to understand accurate statistics, these statistics need to Relying on the statistics of the grassroots departments to ensure the authenticity of statistical data through the formulation of relevant rules and regulations, but the problems existing in many grassroots departments are that their system construction is imperfect, and many system construction and actual statistical work are contradictory. In this case, the use of these systems will lead to problems in the authenticity of statistical data, but will affect the statistical work of the grassroots departments. It is required that the relevant administrative departments of China need to supervise the grassroots departments. The intensity of supervision needs to be grasped according to the actual situation. If the supervision is too high, the work of the grassroots departments will be over-binding, and vice versa will lead to the occurrence of statistical data. distortion. To this end, as the government department of our country, we can manage the grassroots departments from two aspects:

3.1.1 Construction of statistical data work platform

Require local government departments to increase the input of working funds for the grassroots departments of statistical data, and improve the working environment of the grassroots departments as much as possible. Due to the large amount of statistical data, the staff in the grassroots departments are very hard in actual work. In the absence of improvement in the welfare of the grassroots departments, it is easy to cause the enthusiasm of employees in the grassroots departments to decline, not willing to go to work, and not willing to pay for the posts. The relevant government departments are required to increase the enthusiasm of employees in the grassroots departments, improve the welfare, and let the grassroots staff better participate in the actual work.

3.1.2 Establish a chasing system in the grassroots sector

In the statistical data, the responsibility of the employees in the grassroots departments directly guarantees the integrity of the statistical data to a certain extent. To this end, it is necessary to strengthen the responsibility of the staff in the grassroots departments, and require all employees in the grassroots departments to truthfully obtain the data and information obtained. Entry, once the staff of the grassroots department is found to have entered the wrong information and refused to change, they need to pursue the responsibility of the parties. In addition, in order to ensure the authenticity of statistical data, we can also exert the power of social supervision, and comprehensively supervise the work of statistical data. The local government's statistical department is required to regularly publish statistical data to the public, find problems and investigate and solve problems in a timely manner, and investigate the results. Publicize to the community.

3.2 Correction of the work style of the grassroots department

There is a certain relationship between the authenticity of statistical data and the management of cadres at the grassroots level. At present, the government still has the problem of mutual protection of officials. To this end, governments at all levels must improve the evaluation system for cadres, and at the same time require all levels of government to downplay. The concept of political achievements is completely attributed to statistical data, and the distortion of statistical data is avoided to the utmost extent. The following measures can be applied to the following aspects: First, establish scientific assessment targets in the grassroots departments, and accurately implement all statistical data work on each individual's head. In the process of implementing the work, it is necessary to avoid the target. Too high to prevent the occurrence of data due to the target being selected too high. Second, changing the evaluation system of cadres by government departments requires that in addition to the assessment of statistical data in the process of assessing cadres, it also needs to include their own work attitude, work management ability, etc. This will improve the authenticity of the statistics. Third, it is necessary to change the working philosophy of the grassroots departments when conducting statistical data. Many employees in the grassroots departments think that the purpose of their work is to be responsible for the superiors, but the purpose of the work of the grassroots departments is to clarify their duties. Establish a fair, reasonable and efficient statistical order in the grassroots departments to ensure that the grassroots departments ensure the independence of statistical data work when conducting statistical data work, and will not be affected by administrative intervention.

3.3 Strengthen the promotion of statistical data

Many people in China don't know about China's "Statistics Law of the People's Republic of China", and they don't even know the law. The reason for this happening is that China's propaganda on this law is not in place. In everyday life, people Only concerned with the figures presented by the statistics, but they do not understand the meaning they represent. For this reason, as a grassroots department in daily life, it needs to be open to the public, and it needs to be open to the objects and statistical departments surveyed by the grassroots departments. Government departments at all levels in China also need the propaganda of various statistical knowledge, such as propaganda of statistical data through different aspects of the community, schools, enterprises, etc., in the process of propaganda, it is necessary to give detailed introductions to the public and statistical work. The legal and regulatory, statistical data, the significance of its work, the institutional methods, caliber indicators, etc. required to complete the statistical data work, in the statistical data publicity activities, the responsible personnel need to promptly answer the questions raised by the public, Thereby better coordination and support related work on the statistical data of the grassroots departments. In addition, in the grassroots departments, it is necessary to strengthen the statistical supervision of statistical data. The leaders of the grassroots departments need to hold relevant meetings within the grassroots departments on a regular basis to conduct statistics and analysis on the cases of violations of laws and regulations in the grassroots departments. Implement the

accountability system. If the staff of the grassroots departments appear to falsify data and report data in the statistical data, the leaders of the grassroots departments need to deal with them seriously according to the laws and regulations stipulated by China, and must be cut off and counted. The data-related interest chain ensures that the staff of the grassroots departments will not appear to have errors in the statistical data due to the interests in the actual work. At the same time, in the large-scale statistical work, in order to ensure the enthusiasm of the staff in the grassroots departments, rewards and punishments can be adopted. Measures to stimulate the enthusiasm of the staff in the actual work.

3.4 Refine the assessment indicators to improve the quality of personnel

In the actual statistical work of the grassroots departments, it is necessary to refine the evaluation indicators for statistical data work, and establish a set of statistical data working methods in accordance with the actual situation of the local economy and people's livelihood development. It is possible to curb the possibility of distortion in the work of statistical data from the source. For example, at present, in order to ensure the authenticity of statistical data work, China has prevented the grassroots departments from tampering with statistical data due to interest relations and established a national statistical investigation team. Since the statute of the statistical investigation team is not in the local area, the statistical investigation team is The investigation of statistical data will not be affected by the local government, but it will also ensure that the statistical investigation team will ensure independence during the work and ensure that the statistical investigation team will not be affected by local interests. From the perspective of cadres at the grassroots level, in order to ensure the authenticity of statistical data, it is necessary to change the performance appraisal system of employees in the grassroots departments. At present, many regions are evaluating the heroes in the figures. An assessment method has also led many employees in the grassroots departments to tamper with statistical data. Therefore, it is required to combine quantitative assessment and qualitative assessment in the assessment to improve the accuracy of statistical data. In order to ensure that the cadres of government departments work for the people, and require the local government to establish a public service system for cadres, in order to ensure the democratic performance of cadres, it is possible to increase the degree of openness of government cadres and improve government cadres. The sense of responsibility at work makes them realize that every decision they make affects the development of society, affects the living standards and quality of life of the people, and raises the awareness of government officials in serving the people. At the same time, the grassroots departments are required to realize that the authenticity of the statistical data is necessary for them to be the grassroots departments. It is also the bottom line of the grassroots departments. In the work of statistical work in the grassroots departments, the authenticity of the data must be given priority. In terms of location, all grassroots departments are required to strictly follow the principle of seeking truth from facts, so as to eliminate the phenomenon of falsification of statistical data. In other words, the grassroots department is required to do the following: First, as the grassroots department, it is necessary to tell the truth and report the actual number in the face of statistical data, and firmly adhere to the notion of not only, not financial, in the processing of statistical data. Scientific and rational analysis is carried out to avoid distortion of statistical data. Second, there is a need to raise the sense of responsibility of staff in the grassroots departments. Many grassroots department staff are not aware of the importance of statistical data for social development. In the grassroots departments, it is also necessary to create a good working atmosphere so that grassroots departments can work. I can feel comfortable and comfortable. Third, it is necessary to implement the training of staff in the grassroots departments. It is required to regularly organize relevant staff to learn and understand the laws and regulations of China's statistical data, to learn statistical knowledge, and to learn from the advanced statistical methods at home and abroad. A high-quality, complex work team is built in the grassroots department.

4. Conclusion

In summary, the authenticity and accuracy of statistical data are directly related to the development of China's national life, government and enterprises, and at the same time have brought a lot of influence on China's economic development, ensuring that statistical data can truly reflect the social situation is the foundation of social development. source. The grassroots departments are required to solve the problems in the statistical data and the actual situation of the departments, and raise the attention attached to the statistical data. Once the distortion appears in the statistics, it is necessary to find the root of the problem, solve the problem, and let the statistical data help the economic development to promote the construction of a harmonious society. The leaders of relevant departments also need to improve the salary and treatment of the employees of the grassroots statistics and improve the employees. The enthusiasm of work.
